EXPERTISE

According to instructions the present thermoplastic elastomer submitted in the form of sample slides, called

H-ECOPUR

was tested as to its suitability for foodstuffs according to the Law on Foodstuffs with special consideration of its suitability for contact with vegetable oil, alcoholic beverages and sour filling materials

Based on the indicated composition, this elastomer consists of components permitted under the Law on Foodstuffs.

As can be seen from the above findings, the sensory test as well as the total migration examination did not produce any reasons for objection.

Thus there are no objections against the use of H-ECOPUR as a sealing material for food in accordance with the Law on Foodstuffs as long as this elastomer is always used in perfect quality corresponding to that of the examined samples and is processed properly in such a way that the finished products have not negative impact on food.

This expertise is based on the precondition that the entire composition was indicated in full and that no further substances are contained.
