EXPERTISE

According to instructions the present thermoplastic elastomer submitted in the form of sample slides, called

H-ECOPUR

was tested as to its suitability as a sealing material for use in connection with drinking water.

Based on the indicated composition, this elastomer consists of components permitted under the Law on Foodstuffs and according to the above findings it meets the requirements of the Austrian standard ÖNORM B 5014, part 1 for materials made of synthetic rubber.

Thus there are no objections against the use of H-ECOPUR for the production of sealings to be used in connection with drinking water in accordance with the 1975 Law on Foodstuffs, as long as this elastomer is always used in perfect quality corresponding to that of the examined samples and is processed properly in such way as to avoid any negative impacts on drinking water
